(a) expected execution $V_i(m) = \mathbb{E}[\max\{R_{i1}, \ldots, R_{im}\}]$
$V_i(m) - V_i(1)$ (bps of execution)
competitors admitted, m
thin pair (large σ_i)
deep pair (small σ_i)
concave: each added competitor adds less
(b) marginal value $\delta_i(m)$
$\delta_i(m) = V_i(m) - V_i(m-1)$ (bps)
competitor index, m
thin pair (large σ_i)
deep pair (small σ_i)
front-loaded; scales with dispersion σ_i
